

What is HHW?

Household hazardous wastes are substances that poison or contaminate the environment and threaten the health of those in the local community. They may be flammable, corrosive, reactive, or toxic and should be disposed of properly so as not to harm people or damage the region's soil and water resources.

Environment

If these products are poured down the sink or storm drains, they can pollute our drinking water and soil, threatening wildlife and local ecosystems, as well as the health of the surrounding communities.

Municipal treatment plants and leach fields are incapable of processing these chemicals, even landfill disposal can lead to polluting the groundwater.

Health & Safety

If HHW is disposed of together in the trash, it could react and produce toxic fumes, explosions, or fires which could cause injury. When continuously exposed to certain products, it can have adverse short and long-term effects on the body including cancer and birth defects.

Danger to Children

Improper storage of HHW can lead to accidental poisoning of children. Most common poison sources from HHW are personal care products and cleaning substances.

Contact Information
